

Key message:

Cortex XDR is the world's most effective AI-powered endpoint security, proven by 5 years of exceptional results in MITRE ATT&CK evaluations.

Key Personas:

- CISO
- SOC Lead
- Security Architect
- Security Analyst

Identify Problem

Problem statement (pain/need):

- Compromised endpoints: Sophisticated malware bypasses existing Endpoint Security (EDR)
- Experiencing security breaches: Attacks move laterally beyond the endpoint and are missed by EDR
- Security analysts can't see the full context of attacks
- Alert overload for the SOC slows down investigations
- Manual detection and response is too slow to stop modern attacks
- Compliance risks

Keywords/Use Cases to Listen For:

- Endpoint Security / Endpoint Protection (EPP)
- Endpoint Detection and Response (EDR)
- Extended Detection and Response (XDR)
- Using AI to stop threats and improve SOC efficiency
- Antivirus (AV / NGAV)
- Analytics, Incident Response, Automation, Malware, Ransomware

Discovery

Root Cause:

- Siloed detection and response tools mean limited visibility; "EDR" is limited to the endpoint
- The number of devices and endpoints has multiplied.
- Incomplete visibility into endpoints connected to the network
- Insufficient analytics to help identify attacks
- Lack of security expertise / Lack of security operations team members

Business impact:

- Unable to focus on strategic initiatives to address reactive issues
- Hit on brand reputation and goodwill
- Downtime, lost revenue
- Increase in operational costs to address breaches

Discovery questions:

- Are your security alerts from endpoints, cloud, or network disconnected or take a long time to prioritize?
- Does your current endpoint security protect both traditional endpoints like laptops and cloud infrastructure like Kubernetes equally well?
- How much time does your team spend investigating false positives?
- If a breach happens, can your team easily trace how it started and spread, or is it a guessing game?

Competitive Differentiation

- AI-Powered Prevention: Stops attacks at the endpoint with protection against evolving adversary techniques and zero false positives.
- AI-Driven Detection & Analytics: AI analyzes endpoint, network and identity data to reveal how attacks unfold across multiple domains with 100% accuracy, proven by MITRE ATT&CK Evaluations.
- Near Real-Time Response: Reduces alerts by 98% and identifies the root cause of attacks so analysts can respond before a breach.
